AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A wireless communications terminal capable of performing a contactless communications communication and at least one wireless communications communications.

a first wireless communications section operable to perform a wireless communications communication via a communications network other than a contactless communications;

a second wireless communications section operable to perform a contactless communications communication with a predetermined reader/writer based on a command; and

a wireless communications control section operable to (i) analyze, in response to an initiation of a contactless communication performed by said second wireless communications section, a command received by said second wireless communications section, (ii) deactivate said first wireless communications section when the command received is requesting access to a tamper resistant memory (TRM) area or a secure flash memory in a memory management area, and (iii) temporarily deactivate said first wireless communications section when the command received is requesting access to a general area in the memory management area restrict a wireless communications performed by the first wireless communications section based on a status of a contactless communications performed by the second wireless communications section.

2-6. (Canceled)

7. (**Currently Amended**) The wireless communications terminal according to claim 1, further comprising:

a timer section operable to detect an elapse of a predetermined amount of time since an initiation of a contactless-communications communication,

wherein the <u>said</u> wireless communications control section <u>lifts removes</u> the <u>a</u> restriction on <u>a wireless communication via a communications network performed by the <u>said</u> first wireless communications section based on the detection of an elapse of the predetermined time by the <u>said</u> timer section.</u>

- 8. (Currently Amended) The wireless communications terminal according to claim 1, wherein the <u>said</u> wireless communications control section starts restricting a wireless communications communication via a communications network performed by the <u>said</u> first wireless communications section based on an instruction from a user.
- 9. (Currently Amended) The wireless communications terminal according to claim 8, wherein the <u>said</u> wireless communications control section deactivates or temporarily deactivates a wireless eommunications communication function via the communications network of the <u>performed</u> by said first wireless communications section based on an instruction from a user.
- 10. (Currently Amended) The wireless communications terminal according to claim 8, further comprising a second wireless communications control section operable to restrict a contactless communications communication performed by the said second wireless communications section based on an instruction from the user.
- 11. (Currently Amended) The wireless communications terminal according to claim 8, wherein based on an instruction from the user, said the wireless communications control section also restricts a contactless communications communication performed by the said second wireless communications section in such a manner that either one of the contactless communications communication and the wireless communications communication via the communications network is restricted at a time based on an instruction from the user.
- 12. (Currently Amended) The wireless communications terminal according to claim 8, further comprising:
- a timer section operable to detect an elapse of a predetermined amount of time since an initiation of a contactless communications,

wherein the said wireless communications control section lifts-removes the restriction

on the <u>said</u> first wireless communications section based on the detection of an elapse of the predetermined time by the said timer section.

13. (Currently Amended) A communications protocol switching method used by a wireless communications terminal comprising a first wireless communications section for performing at least one wireless communications communication via a communications network other than a contactless communications, and a second wireless communications section for performing a contactless communications, communication with a predetermined reader/writer based on a command, the method comprising the steps of:

determining <u>a status an initiation</u> of <u>the a contactless communications communication communication communications communic</u>

analyzing, in response to the contactless communication, a command received by the second wireless communications section; and

deactivating the first wireless communications section when the received command is requesting access to a tamper resistant memory (TRM) area or a secure flash memory in a memory management area, and temporarily deactivating the first wireless communications section when the received command is requesting access to a general area in the memory management area.

restricting the wireless communications performed by the first wireless communications section based on the status of the contactless communications.

14. (Currently Amended) A communications protocol switching program stored on a computer-readable medium that is executed by a wireless communications terminal comprising including a first wireless communications section for performing at least one wireless communications communication via a communications network other than a contactless communications, and a second wireless communications section for performing a contactless communications communication with a predetermined reader/writer based on a command, the program causing the wireless communications terminal to perform comprising the steps of:

determining a status an initiation of the a contactless communications communication performed by the second wireless communications section; and

analyzing, in response to the contactless communication, a command received by the second wireless communications section; and

deactivating the first wireless communications section when the received command is requesting access to a tamper resistant memory (TRM) area or to a secure flash memory in a memory management area, and temporarily deactivating the first wireless communications section when the received command is requesting access to a general area in the memory management area.

restricting the wireless communications performed by the first wireless communications section based on the status of the contactless communications.

15. (Currently Amended) An integrated circuit used in a wireless communications terminal capable of performing a contactless eommunications communication and at least one wireless eommunications communication, wherein: the wireless communications terminal eomprising including a first wireless communications section for performing a wireless communications communication via a communications network other than a contactless communications, and a second wireless communication section for performing a contactless communications communication with a predetermined reader/writer based on a command; and, the integrated circuit comprising:

the integrated circuit includes a circuit functioning as a wireless communications control section operable to (i) analyze, in response to an initiation of a contactless communication performed by the second wireless communications section, a command received by the second wireless communications section, (ii) deactivate the first wireless communications section when the received command is requesting access to a tamper resistant memory (TRM) area or a secure flash memory in a memory management area, and (iii) temporarily deactivate the first wireless communications section when the received command is requesting access to a general area in the memory management area wireless communications performed by the first wireless

communications section based on a status of a contactless communications performed by the second wireless communications section.
